No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

"Human Sir2-related protein SIRT1 associates with the bHLH repressors
HES1 and HES2 and is involved in HES1- and HEY2-mediated
transcriptional repression.";
Biochem. Biophys. Res. Commun. 301:250-257(2003).
-!- FUNCTION: Transcriptional repressor of genes that require a bHLH
protein for their transcription. May act as a negative regulator of myogenesis by inhibiting the functions of MYOD1 and ASH1 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -u-suminativy...

SUBBURIT: Transcription repression requires formation of a complex with a co-repressor protein (Groucho) such as TLE2 (By similarity). Interacts with SIRTI.

SUBCELLULAR LOCATION: Nuclear.

-i- DOMAIN: Has a particular type of basic domain (presence of a helix-interrupting proline) that binds to the N-box (GACNAG), rather than the canonical B-box (GANNTG).

-i- DOMAIN: The carboxyl-terminal WRPW motif is a transcriptional repression domain necessary for the interaction with GROUCHO, a transcriptional co-repressor recruited to specific target DNA by HAIRY-related proteins.

-i- SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Watanabe K., Kumagai A., Itakura S., Yamazaki M., Tashiro H., Ota Suzuki Y., Obayashi M., Nishi T., Shibahara T., Tanaka T., Makamura Y., Isogani T., Sugano S., Isogani T., Subanitted (FEB-2000) to the EMBL/Genbank/DDBJ databases.

-1. FUNCTION: Essential component of the RNA polymerase and the
nascent chain assembly complex. Also required during RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -! - RNA DITING: Modified positions=164; Note=Partially edited. RNA editing at this position consists of an insertion of two guanine nucleotides. The sequence displayed here is the P protein, derived from the edited RNA. The unedited RNA version gives rise to the V protein (AC P36315).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

RT "Requiation of the Neurospora circadian clock by casein kinase II.";

Genes Dev. 16:994-1006(2002).

-!- FUNCTION: Circadian clock component involved in the generation of langth, and temperature compensation. Oscillates in abundance with a daily peak early in the morning. Behaves as a negative element of in circadian transcriptional loop. May bind to wc2 protein. The complex frq wc2 may turn off the expression of frq.

-!- ALTERNATIVE PRODUCTS:

COMMENTE-2 isoforms. Long (8hown here) and Short, are produced by alternative initiation. The isoform Long maintains rhythms at lower temperature (18 degrees Celaius);

-!- INDUCTION: By light; perhaps through white collar-1 (wc1) and maintains rhythms at lower temperature (18 degrees Celaius);

-!- Thy representive phosphorylation is also involved in regulating frq degradation. Phosphorylation is also involved in regulating frg degradation. Phosphorylation is also involved in regulating frg degradation. Phosphorylation between frg and the white collar proteins, and complex formation between frg and the white collar proteins, and read-hark long.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. Viruses; dsDNA viruses, no RNA stage; Adenoviridae; Mastadenovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -i. FUNCTION: Circadian clock component involved in the generation biological rhythms, in particular in rhythm stability, period length, and temperature compensation. Behaves as a negative element in circadian transcriptional loop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Refunction Histone methyltransferase. Preferentially methylates

Lyg-9 of histone H3 and Lyg-27 of histone H3 (in vitro): H3 Lyg-9 of histone H3 and Lyg-7 of histone H9 proteins to methylation represent a specific tag for epigenetic reanscriptional repression by recruiting HP1 proteins to methylated histones. Probably targeted to histone H3 by different methylated histone H1 (By similarity).

C. - CATALYTIC ACTIVITY: S-adenosyl-L-methionine + histone L-lysine = S-adenosyl-L-homocysteine + histone L-lysine.

S. - CATALYTIC ACTIVITY: S-adenosyl-L-methionine + histone L-lysine = S-adenosyl-L-homocysteine + histone L-lysine.

S. - CATALYTIC ACTIVITY: S-adenosyl-L-methionine + histone L-lysine.

S. - CATALYTIC ACTIVITY: S-adenosyl-L-methionine + histone L-lysine.

S. - CATALYTIC ACTIVITY: S-adenosyl-L-methionine + histone L-lysine.

S. - CATALYTIC ACTIVITY: S-adenosyl-L-methonine.

S. - CATALYTIC ACTIVITY: S-adenosyl-L-methonine.

C. - SUBDNIT: Part of the E2P6. com-1 complex in G0 phase composed of E2F6, MGA, MAX TFDP1, CBX3, BAT8, EUHMTASE1, RING1, RNF2, MBLR, CC-1-SUBCELLUMAR LOCATION: Nuclear; associates with euchromatic regions. Does not associate with heterochromatin.

C. - ALTERNATIVE ROOUCTER.

ISOIMIARITY: Belongs to the histone-lysine methyltransferase family. Suvara-3 subfamily.

ISINILARITY: Contains 7 ANK repeats.

ISINILARITY: Contains 1 Dre-SET domain.

ISINILARITY: Contains 1 Dre-SET domain.

ISINILARITY: Contains 1 Dost-SET domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SMART; SM00248; ANK; 6.

Transferase; Methyltransferase; Chromatin regulator; Nuclear protein;
Lys-9 of histone H3 and Lys-27 of histone H3 (in vitro). H3 Lys-f methylation represents a specific tag for epigenetic transcriptional represents by recruiting HP1 proteins to methylated histones. Also methylates histone H1.

-! CATALYTIC ACTIVITY: S-adenosyl-L-methionine + histone L-lysine = 3-adenosyl-L-methionine + histone L-lysine = 1-SUBUNIT: Part of the B2F6.com-1 complex in G0 phase composed of E2F6, MGA, MAX, TFDP1, CBX3, BAT8, EUHWTASE1, RING1, RNF2, MBLR, L3MBTL2 and YAF2 (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear; almost excluded form nucleoli.

Associates with euchromatic regions. Does not associate with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ive splicing.

Eplicing of isoform 2; TISSUE SPECIFICITY: Ubiquitous. Expressed prior to cellularization in stage 3 embryos, and in blastoderm cells, including pole cells. Expressed throughout the rest of embryogenesis. Later, it is expressed at higher level in epidermal cells and CNS.

DEVELOPMENTAL STAGE: Isoform 3 is expressed both maternally and
                                                                                                                                                                                                      signaling...

Rey pathways such as the EGF receptor and Wg pathways. Involved in neuronal cell fate, survival and axon guidance, cell cycle regulation and repression of head identity in the embryonic trunk. May act with the Hox gaene Deformed and the EGF receptor signaling pathway. Positive regulator of the Wg pathway in larval tissues but not in embryonic tissues. May act as a transcriptional corepressor protein, which repress transcription via the recruitment of large complexes containing histone deacetylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                proteins.
SUBCELLUAR LOCATION: Nuclear.

Event=Alternative promoter;
Comment=2 isoforms, 1 (shown here) and 2, are produced by use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SIMILARITY: Belongs to the Spen family.
SIMILARITY: Contains 3 RNA recognition motif (RRM) domains.
SIMILARITY: Contains 1 SPOC domain.
CAUTION: It is uncertain whether Met-1 or Met-7 is the initiator.

YE TUNCIYON: Porce-forming (alpha) subunit of voltage-gated inwardly rectifying potassium channel (By similarity).

C -! FUNCIYON: Porce-forming (alpha) subunit of voltage-gated inwardly rectifying potassium channel is probably composed of a homo-or hore-arcteramento complex of pore-forming alpha subunits that can associate with modulating beta subunits (By similarity).

C -! SUBCELIULAR LOCATION: Integral membrane protein.

C -! DOMAIN: The segment S4 is probably the voltage-sensor and is characterized by a series of positively charged amino acids at every third position.

C -! SIMILARITY: Belongs to the potassium channel family. H (Eag)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       subfamily.

-! SIMILARITY: Contains 1 cyclic nucleotide-binding domain.

Myocardin. a novel potentiator of SRF-mediated transcription in cardiac muscle.";

Mol. Cell 8:1-2(2011)

L Mol. Cell 8:1-2(2011)

C multiple CArd boxes DNA sequence. Acts as a cofactor of serum response factor (SRF) with the potential to modulate SRF-target genes. Regulates the expression of a set of cardiac and smooth muscle-specific genes. Plays a crucial role in cardiogenesis and differentiation of the smooth muscle cell lineage (myogenesis).

May bind matrix attachment regions through its SAP domain.

-1- SUBUNIT: Homodimer (By similarity). Interacts with SRF, its association does not depend on specific DNA sequences for ternary

complex formation.
SUBGEL/ULAR LOCATION: Nuclear, with a punctate intranuclear pattern with exclusion from nuclei.

MEDLINE=55046811; PubMed=7958365; PearThey LW., Skehell J.M., Walker J.E.; PearThey LW., Skehell J.M., Walker J.E.; PearThey LW., Skehell J.M., Walker J.E.; Electropray ionization mass spectrometric analysis of subunits of NADH:ubiquinone oxidoreductase (complex I) from bovine heart mitochondria.; Plans. 22:551-555(1994).

-I- FUNCTION: Transfer of electrons from NADH to the respiratory on Anion. The immediate electron acceptor for the enzyme is believed to be ubiquinone.

-I- CATALYTIC ACTIVITY: NADH + ubiquinone = NAD(+) + ubiquinol.

-I- CATALYTIC ACTIVITY: NADH + ubiquinone = NAD(+) + reduced acceptor.

-I- SUBGENLIAR LOCATION: Integral membrane protein. Mitochondrial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             15-UTL-1999 (Rel. 38, Created)

-!- FUNCTION: Transfer of electrons from NADH to the respiratory chain. The immediate electron acceptor for the enzyme is believed to be ubiquinone (By similarity).
-!- CATALYTIC ACTIVITY: NADH + ubiquinone = NAD(+) + ubiquinol.
-!- CATALYTIC ACTIVITY: NADH + acceptor = NAD(+) + reduced acceptor.
-!- CATALYTIC ACTIVITY: NADH + acceptor = NAD(+) + reduced acceptor.
-!- SUBGUNIT: Mammalian complex I is composed of 45 different subunits.
-!- SUBGELIULAR LOCATION: Integral membrane protein. Mitochondrial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                       "Cytochrome of sequence variation among the recognised species of purple nonsulphur photosynthetic bacteria.";
Nature 278:659-660 (1979).
-!- FUNCTION: CYTOCHROME OI IS FOUND MAINLY IN PURPLE, NONSULFUR, PHOTOSYNTHETIC BACTERIA WHERE IT FUNCTIONS AS THE ELECTRON DONOR TO THE OXIDIZED BACTERIOCHLOROPHYLL IN THE PHOTOSHOSPHORYLATION PATHWAY. HOMEVER, IT MAY ALSO HAVE A ROLE IN THE RESPIRATORY CHAIN AND IS FOUND IN SOME NONPHOTOSYNTHETIC BACTERIA.

Ambler R.P.;
Submitted (JUN-1977) to the PIR data bank.
-!-FUNCTION: CYTOCHROME CZ IS FOUND MAINLY IN PURPLE, NONSULFUR,
-!-FUNCTION: GACTERIA WHERE IT FUNCTIONS AS THE ELECTRON DONOR
TO THE OXIDIZED BACTERIOCHLOROPHYLL, IN THE PHOTOPHOSPHORYLAITON
PATHWAY. HOWEVER, IT MAY ALSO HAVE A ROLE IN THE RESPIRATORY CHAIN
AND IS FOUND IN SOME NONPHOTOSYNTHETIC BACTERIA.
                                                                                                                                                                                                            (In) Matsubara H., Yamanaka T. (eds.);

*Incompared to the control of the control of the cytochrome c heme group can accept an electron from the heme group of the cytochrome c labbunit of cytochrome reductase. Cytochrome of the cytochrome clabbunit of cytochrome reductase. Cytochrome of the cytochrome cut then transfers this electron to the cytochrome oxidase complex, the final protein carrier in the mitochondrial electron-transport
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -!- SUBCELLULAR LOCATION: Mitochondrial matrix.
-!- PTM: Binds 1 heme group per molecule.
-!- PTM: Binds 1 heme group per molecule.
-!- PTM: MISCELLUARBOUGS COMPARED CONTROL Cytochrome c's lacks one of the two cysteines that covalently bind the heme group.
-!- SIMILARITY: Belongs to the cytochrome c family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A.Molecule type: genomic RNA
A.Residues: 1-27 <ICH>
A.Cross-references: GB.14796
A.F.Experimental source: lymphocytes of peripheral blood
C.Comment: This enzyme catalyzes the first and rate-limiting step of catecholamine blosy
C.Superfamily: phenylalanine 4-monooxygenase
C.Keywords: biopterin; monooxygenase; oxidoreductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A)Cross-references: GB:L14799

i Sequence 3, Application US/09848834A
i Patent No. US20020056416A1
i GENERAL INFORMATION:
i APPLICANT: Aphton Corporation
i TITLE OF INVENTION: Chimeric Peptide Immunogens
FILE REFERENCE: 1102865-0047
CURRENT APPLICATION NUMBER: 00/09/848,834A
i CURRENT FILING DATE: 2000-05-05
i PRIOR APPLICATION NUMBER: 60/202,328
i PRIOR APPLICATION NUMBER: 60/202,328
i NUMBER OF SEQ ID NOS: 20
i SOFTWARE: PatentIn version 3.0
i SEQ ID NO 3
i TYPE: PRT
i OKCANISM: Plasmodium falciparum
i FEBATURE:
i NAME/KEY: PEPTIDE
i COCTHER INFORMATION: Amino acid sequence 378-398 of the Plamodium
i OTHER INFORMATION: Amino acid sequence 378-398 protein

Patent No. US20020076416A1

GENERAL INFORMATION:

APPLICANT: Aphton Corporation

TILE OF INVENTION: Chimeric Peptide Immunogens

FILE REFERENCE: 1102865-0047

CURRENT APPLICATION NUMBER: US/09/848,834A

CURRENT APPLICATION NUMBER: 60/202,328

PRIOR PLING DATE: 2001-05-04

PRIOR PLING DATE: 2000-05-05

NUMBER OF SEQ ID NOS: 20

SOFTWARE: Patentin Version 3.0

SOFTWARE: Patentin Version 3.0
                                  APPLICANT: Aphen Corporation

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Circumsporozoite protein precursor - Plasmodium cynomolgi (strain London)
NiAlternate names: major sporozoite surface antigen
Cispecies: Plasmodium cynomolgi
Cispecies: Plasmodium cynomolgi
Cjacesion: A2625
RACCESION: A2625
RAGalinski, M.R., Arnot, D.E.; Cochrane, A.H.; Barnwell, J.W.; Nussenzweig, R.S.; Enea, R; Refarence number: Apo889; MUD:87102878; PMID:3802196
A; Reference number: A90889; MUD:87102878; PMID:3802196
A; Reference number: A90889; MUD:87102878; PMID:3802196
A; Residues: 1-378 cdAL.
C; Comment: There are three distinct regions in the mature circumsporozoite protein, the objc membrane-anchoring sequence. Comment: There are 19 tandem copies of a 6-residue repeat and 6 copies of an 11-resid C; Superfamily: circumsporozoite protein; thromobospondin type I repeat homology C; Superfamily: circumsporozoite protein; tandem repeat
C; Superfamily: circumsporozoite protein; thromobospondin type I repeat homology C; Reywords: sporozoite; surface antigen; tandem repeat

Patent No. US20010014330A1
GENERAL INFORMATION:
APPLICANT: HARLAND:
APPLICANT: ACRES, STEPHEN D.
TITLE OF INVENTION: IMMUNIZATION AGAINST ENDOGENOUS
TITLE OF INVENTION: MOLECULES
NOMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSE: ROBINS & ASSOCIATES
STREET: 90 MIDDLEFIELD ROAD, SUITE 200
CITY: MENDING PARK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               COMPUTER READABLE FURM:
